

An Essay

ON

THE CORRELATION OF PHYSIO-PATHOLOGY
TO
THERAPEUTICS.

Respectfully Submitted to the Faculty
of the
Homoeopathic Medical College of Pennsylvania;

By
A. Williams,
of Pennsylvania.

Feb. 1st. 1858.

"Quo Mentis Est."

Similia Similibus Curantur

"When we have to do with an ART whose end is the saving of human LIFE, any neglect to make ourselves thoroughly masters of it becomes a crime!"

Hahnemann.

SSC.

Gentlemen.

Three years' hasty
conning of the tomes of Allopathy
(into which I entered with considerable
enthusiasm) were quite sufficient to
convince me of the unscientific and
irrational basis upon which that
gigantic superstructure of Empiricism
Experiments, and Theories is founded.
And it is only since I have renoun-
ced the beaten track of "Contraria", and
examined to a short extent the law
of "Similia", that I have been enab-
led to see the harmonious blend-
ing of Truth and Reason in the science
of Therapeutics. It is therefore in
consideration of this grand and
universal "law of cure", that I have
chosen the above, as the subject of my

Thesis. Not for any lingering devotion I have. I assure you, for the rude and antiquated system of the "Fathers." But, from a conviction, that a correct knowledge of the sciences of Physiology and Pathology, with their proper appliances in disease, is the true foundation of Therapeutics.

It cannot be expected that, a subject of so extensive limits, and of such vast utility, can be confined to a few pages. I therefore solicit your kind indulgence, while I pursue (rude and unprofitable, as it may be), the theme of my choice.

There is perhaps no subject in the whole curriculum of our studies as Medical Students, which is of more vital importance to the thorough completion of our Medical Knowledge

and to our skill and success as future practitioners of the great and noble Therapeutic Law: "Similia. Similibus Curantur" than this: nor one in which the Homeopathic practitioner of this electric age, should be more thoroughly posted: the very want of which, is so often tauntingly flung, into our faces, by the infatuated devotees of Allopathy. How often do we hear the cant phrase, "O. he is nothing but a mere symptomtologist." "What does he know of the nature and cause of disease?" "What does he know of the arrangements and operations of the organs of the body? their regularities in health, or derangement in disease"? I will not therefore justify their blind zeal; for I am assured that "Truth though crushed to earth", even by the iron clad

heel of Empiricism, in all its "Protean" forms, and armed to the teeth by the thousands of jagged head of "Medusa", "shall arise again "Phenix" like, from its own ashes" with redoubled strength and vigor, to move steadily and firmly on to honored victory, if we but prove faithful to the cause we have espoused. Confident then that "we shall be known and read of all," it becomes us that we be workmen that need not be ashamed, that our work may be approved, even by our enemies.

It is not enough that we are good symptomtologists merely. a
But we are obligated also to be well versed in the laws that control Health & Disease. And where can we obtain this requisite information,

But in a careful study of Physiology
 and Pathology? Then link them
 with the former, and we have
 an Herculean cable, upon which to
 depend, and bid a triumphant
 defiance to the wrathful imprecations
 of our conscience smitten, and spirit
 quenching "regulars". But I would
 not foster the "hobby", as they, so
 that I should be deterred from treat-
 ing my patients until I had first
 gone and fathomed the musty tomes
 of Pathology for a name, and hav-
 -ing found one, turn to the well-stocked,
 double entry "formulary," and there
 opposite the name of my disease,
 (which we will call "Typhus Fever,")
 I have my remedy, well tested, tried
 and faithful, thro' a long list of long-
 er past-away "worthies," even from the

antiquated days of old grandfather
 "Esculapius", down to the present day.
 But why, asks one, "upon what principle
 do you prescribe for this disease"? O!
 I have no principle particularly, but
 the long and tried experience of those
 who have preceded me. It has ans-
 -wered admirably in their hands &
 I can certainly rely upon their
 superior judgment, in the case.

Here, says the doctor, is a record,
 "Mehemed Agha, an upholsterer,
 cured of Typhus Fever, by drinking
 a pail-full of pickled Cabbage juice".
 The worthy doctor was soon called
 to see a patient who had the
 disease in question, He forthwith
 prescribed a "pailfull of pickled cab-
 -bage juice". On calling the next day,
 to congratulate his patient, on his

recovery. Conceive his astonishment, on being told, his patient was dead? The Oriental Esculapius in his bewitched /
 illdements, as to these phenomena, came to the safe conclusion, and duly noted it in his memoranda, that, "Although in cases of Typhus Fever /
pickled Cabbage juice was an efficient remedy, it is not, however, to be used unless the patient be by profession an /
 'Upholsterer'."

Fortunately for the community, Empiricism is at our day much improved, which may be attributed to the enlightening influence of Homeopathy, which has done more to open the eyes, and awaken the minds of the intelligent community, to a careful search after truth in Medical Science, than any other event in the Archives of Medicine

Since the days of Hippocrates and Galen, Methinks I can picture, the physician, devoid of a proper knowledge of the human organism both in a state of health and disease, lost in the misty mazes of doubt and perplexity; groping his way amid the Ebon Clouds of ignorance, and tampering with the noblest structure of God's Creation.

Should he be so favored, that the malady he has treated, takes its departure, the physician is extolled for his skill, as profoundly erudite, in his profession. But, on the other hand, should the pestilence overleap, his vigilance, and the patient lost. What then? The penalty falls with redoubled momentum, upon the science of Therapeutics, and the ignorance of its pretended defenders, is

covered by the hands of a "licensed permission."

I have been surprised, ^{to see} Medical Students, give this subject so little weight. I am fully convinced, that it is not from a want of thorough instruction on the part of our worthy Faculty, of whose indefatigable assiduity, in seeking to impress this truth upon our minds, I am pleased to bear testimony.

I fully believe it to be the earnest conviction of each one of them, that, to be a symptomatologist; however profound, with a mere smattering of the Collateral sciences, is not enough. That it has been the earnest endeavors, of each one of them, to implant the radical seeds in our minds, is fully vindicated in their teachings.

Prof. Williamson tells us, that he should

be a physician in the broadest sense of the word". And Prof. Coxe says, "the mere symptomtologist may cure disease, but he alone, is truly Scientific, who selects his remedies in accordance, with the Pathology of the case; and, moreover, that no one can be a good Pathologist, who is ignorant of Physiological principles". We understand then, that a physician should be a thoroughly educated and scientific individual. But, that it takes much time, and diligent perseverance, to accomplish this, no one will for a moment question; and the young man who entertains the hairbrained idea that when the Curriculum of College studies, has been gone through with, and with diploma in hand, says, "I have finished my studies", should remember the

deserved rebuke of Dr. Rush upon a similar occasion. "Finished your studies! Well you must be a happy young man, for I never expect to finish mine while I live". We see then the extensive field, that unfolds itself to the enquiring mind of the young man who enters this arena as expansive as time itself, and as responsible as it is expansive. I fully believe that the true physician is limited in Therapeutics, only by the universe and his own judgments. His mind should embrace a knowledge of the medical adaptation of every remedy, and of every measure, guaranteed to him by human knowledge, and the Homeopathic Therapeutic Law. In the language of Dr. Drake, "whenever we can take hold of, and make use of any substance to

produce a beneficial effect upon the system, we are at liberty, and ought to use it". And again; Dr. Seste says, "the true medicine is that which cures, however administered".

To him, there is no new system of Cure, only advances, in knowledge. The law is as old as the everlasting hills. By its virtue diseases have been cured in all ages. The great Fathers of Medicine, beheld its beauty, and admired its effects in their day, as we find recorded by Hippocrates. The following; - "Dolor, dolorem solvit", or, pain, removes pain. "Gaudet, ventriculus, frigidus frigidus"; or, a cold stomach, requires cold things. Even Aldo Galen, the father of the law "Contraria", admits its truth. He says, "Simile ad sibi simile natura fertur"; like is by nature led to its like.

again;— Simile ad suum, simile tendit,
naturaliter", which means, like naturally
tends to its like. But it was not for
them to explain why all this was so:
singular enough no doubt to them.
It remained undemonstrated, grandly
and harmoniously doing its work, until
the middle of the 18th Century ushered
in the dawning day of the immortal
Hahnemann, whose indefatigable zeal;
scrutinizing intellect; indomitable
courage; and unyielding perseverance;
unveiled for the first time the great
Law "Similia", which has emblazoned
his name in adamant character,
high upon the imperishable "Cenotaph"
of renown; to be toppled and rent, only
by the inevitable wreck of time itself.
But, we will turn more directly to the
subject, Physiology, I understand to

consist in those phenomena exhibited by the human organism, during the continuance of Health or, normal life. While, on the contrary, when those phenomena occur in a disturbed and irregular manner, they constitute disease, or abnormal life; and become the subject of the science of Pathology. It is impossible to draw a precise line of demarcation, between health and disease; since many varieties occur which do not pass the limits, of what must be called in some individuals the normal state; but which must be regarded as decidedly abnormal conditions in others. The sciences of Physiology & Pathology are therefore not only closely related with each other, but as intimately allied with Therapeutics; so that one cannot be pursued with success, except in conjunction

with the others. I feel convinced that, our fundamental ideas of healthy, vital action must rest on a knowledge of the structure, composition, and operations of the various parts of the human fabric; and in like manner our fundamental notions of the changes, in which disease essentially consists, must rest upon the detection of the perversions which the actions of those parts undergo; and of the minute alterations of structure & composition which they involve. Now, the inference to be deduced is, that no one can be a Scientific Practitioner, who is devoid of such knowledge. The phenomena of Disease, have been too much isolated from those of Health, as if they belonged to quite a distinct category, and were dependent upon a set of causes altogether dissimilar,

16.

There is an important truth we should
not lose sight of; and which I fear
is too often disregarded. It is this. - That
every diseased action, is but a perverting
by excess, by diminution, or, by depravation
of some natural function; and that
only through an acquaintance with
the latter, can the former be under-
stood; (other, than in an empirical
fashion), either as to its cause its na-
ture, or its tendencies. Lord Bacon
says: "it is the office of science, to
shorten the long turnings of experience".
I hold this to be as true in Medicine,
as in Mechanics. I think the age
is not far in the perspective, when
Medical Science shall have acquired
that state of perfection, that it can
not only say what is, or what happens,
to a certainty in the human body,

in a state of health or disease, but also, what will happen, when the conditions are altered. It will then enable the true physician to say reliably, "do this," "avoid that".

The subject of Physio-Pathology, and its adaptation to the treatment of disease, opens to the enquiring mind, a vast field of inexhaustible treasure. I shall enumerate some of its advantages. It aids us in the preventing of disease. In the treatment of disease.—to a knowledge of the action of remedies—to a knowledge of the cause of disease—it determines between Medical & Surgical disease, and tells us when, the case should be handed over to the Surgeon.—it determines in the proving of drugs.—it aids in a knowledge of the proper diet.—It tells us why the body requires one kind

of food in winter, & another kind in summer — or an increase at one time and a diminution at another — why the diet should be changed in sickness, & why a certain kind should be allowed, and another forbidden. It enables us to give some advice in the training of children; shows why medicines taken in one form are more readily received into the system, than when taken in another. It shows us the cause of, to some extent, & also why one member so readily suffers with another, in disease. It instructs us in the minute structure, composition, & intricate arrangement of the mighty machine, the human body, — of its composition — its physical and vital properties. — It teaches us the effect of organic, inorganic, & foreign

substances in the body - & the disastrous consequences of the nonelimination, of the food, & the consequent retention of various excrementitious substances in the animal economy. In a word, it is the key to Aetiology, Diagnosis, Prognosis, Therapeutics, & Hygiene - each of which would constitute a volume in its description. But, to do each of them the justice they demand, requires more perception than I have yet acquired, and more time (wishes), than you would allow for investigating. I shall content myself therefore with a few observations, to some extent illustrative of the subject under consideration. In the treatment of disease we are led to look at the phenomena of Life, from much the same point of view, as that, from which,

we now regard those of Physical Science. viz. - as the result of a kind of force acting through, or upon organized matters. I believe therefore, that the idea of Prof. Hempel is perfectly rational, viz. - "There is in every disease a set of symptoms, developed which exactly simulates the principle of a certain drug; or, in other words, the Morbific principle entering into the human organism & constituting disease, is precisely similar to a constituent element entering into, and constituting a certain drug. -

We therefore, have the drug principle & from without, entering into the human economy & creating a disease capable of being cured by the drug itself." We should not then expect the cause, to originate within the sys-

tem; Neither, on the contrary should
 we expect always to cure disease, by
 the introduction of drugs into the sys-
 tem. - The Therapeutic Agent is often to
 be found in some power or agent, external
 to it, and operating through it upon
 the contained vitality. This power
 we find in Light, Heat & Electricity,
 which have been denominated the "vital
 Stimuli". Now, it seems evident that,
 their operation, either singly, or combined,
 is necessary, to enable an organized struc-
 ture to manifest vital phenomena.
 Just as Light, acting upon the living
 vegetable cell, makes it the instrument
 of decomposing Carbonic Acid, water, and
Ammonia & of generating an organic
 Compound, suited in every respect as prop-
 er nutriment for the human organism.
 Can we not here perceive the "Vis Medica" =

icatrix Naturæ." of the human economy? But, this is not, as is often supposed, self-acting. It is dependent to a great extent upon exterior agents for power to develop it into activity. We have a most beautiful illustration of this, in a grain of corn, which, though possessed of vitality in itself, will never germinate, unless supplied from without with materials of growth, viz:—heat, oxygen, & water. If any one of these essentials be absent disease results; if all are wanting death ensues.

In the development of the human organism, the animal cell cannot, like that of the plant, generate pabulum for itself out of the inorganic elements around it; but is dependent upon that which has been prepared for it. In Man, this pabulum

is furnished to each growing part by the circulating fluids, which has been previously, and properly prepared for it. It is all important then, that this fluid contain the appropriate materials, suited to each particular part assigned it. Now, as there are various groups of cells, and each group requiring different nutritive components, how important, that the Blood should carry to each part its rightful demands, in order that the life of that part be healthfully preserved. Thus, in a case of Rachitis, if the physician be ignorant of the cause, (that it is owing to a deficiency of the proper pabulum of bone, in the circulation,) he can never successfully treat his case. If it is our province therefore, to regulate the diet of our patients, it is our duty most

thoroughly to understand the combining nature of different kinds of Aliment in the human economy. In the Sacharine & Oleaginous compounds, we have the fuel necessary to the calorification of the body. The first, is purely so, & the latter, serves rather as a connecting link, between the histogenetic substances, and the mere combustive materials, and entering in some proportion into both. We should, then, understand that a well arranged dietetic scheme ought to consist of such a combination of the Albuminous, Oleaginous & Farinaceous constituents, as are most appropriate to the requirements of the system. Thus, when an unusual amount of Nervo-muscular exertion is used, a larger measure of the Albuminosis is required, and this is

obtained most advantageously from animal flesh. When required to sustain the necessary heat in a frigid atmosphere, a larger measure of the Oleaginous is required, and this can be found both in the Animal & vegetable Kingdoms. Again, under a high atmospheric temperature, we have but little need for either the Albuminous or Oleaginous, but we find the Farinaceous articles most favorable to health. Now, an habitual excess in the use of either of these constituents, above what the demands of the system require, tends to the production of a particular "diathesis," which may manifest itself in a variety of diseases. Thus, with an excess of the Albuminous Compounds, as is likely to occur when too large a proportion of animal food is used, undoubtedly favors the Arthritic "diathesis," which is thought

to consist in the presence of imperfectly assimilated histogenetic matters & wrongly metamorphosed products of disintegration, that are not duly eliminated by the kidneys; and then, it not only displays itself in gout & gravel, but modifies the course of other diseases. Again, an excess of the Oleaginous compounds, tends, to the production of the Bilious "diathesis". Then, an excess of Aminaceous matters, especially when combined with a deficiency of Albuminous, tends to the production of the Rheumatic "diathesis". So, a deficiency of the Oleaginous matters, seems to tend to the development of the Scrofulous, while that of fruits & vegetables to the Scorbutic. Then, as the Blood, is formed at the expense of the food; and constantly circulating through all parts of the body; and, that all the

tissues have the power of drawing from this liquid, and of appropriating to their use the particular components of its substance; we can readily understand, how important is a well regulated diet; and, also, how necessary the variety of food required by the body, as well, as the time, and method of administering it. Pereira has justly remarked that, "the living body, has no power of creating elementary substances." Showing, conclusively, that the system is not only supplied with nourishing pabulum from without, but also, with the elements of disease from the same source. Now, the Blood, not only supplies the histogenetic materials to the system, but, at the same time furnishes the means of removing the effete or worn out particles, from the body. Now,

so long, as the excretory apparatus, performs its normal function, all goes on harmoniously. But let a total, or even a partial interruption of this wise provision take place; and how terribly disastrous the consequences. Let a total interruption to the excretion of Carbonic Acid gas occur, we have fatal Asphyxia. Let the Biliary & Urinary excretions be checked, and thrown back into the circulation; we can expect nothing but a most fertile source of disease. Can we not thus account for the "Materies Morbi" of Gout, Rheumatism &c? The presence of Toxic matters in the Blood seem to act as ferments, and soon, destroy its vital properties. Such examples we find in the poison of Typhus, Plague, Glanders, Prustule Maligne, Cholera, Puerperal Fever

and other "Zymotic" diseases. Thus, in Cholera, as an example; It is found that no antecedent condition has been found so efficacious in augmenting its fatality, as, overcrowding. In this position, the subject is, compelled, constantly, to breathe an atmosphere, not only charged, doubly and trebly with Carb. acid, but laden with putrescent emanations, which favors the accumulation & decomposing matter in the blood, & serves as a most fertile soil for the disease. Again, "Puerperal Fever," says Carpenter "is induced by this fermentable matter produced by the rapid decomposition of the tissues of the uterus, acting upon the blood of the parturient female, which has been rendered peculiarly favorable to its action, and which might at other times prove

innocuous, is now made the fertile source of that very disastrous Zymosis." There is a class of Toxic diseases, that have a natural tendency to the self-elimination of the poison, & of the products of its action on the blood, either by the operation of the ordinary excretory organs, or by some peculiar local actions or by a special determination to some one or more organs of the system; and, this, may be the peculiar characteristic of the disease. For example; the skin affection in the Exanthemata; or it may exhibit itself in that organ or tissue whose previous nutrition was least healthy; as in the metastasis of Gout to some internal viscera. We observe a striking characteristic in the Exanthemata. For is it not the case, that constitutional symptoms, especially, the

fever and delirium, are most severe before the eruption comes out? and also greater danger of the life of the patient, when the eruption does not fully develop itself; and when it is repurcussed our Prognosis should always be unfavorable. From these phenomena, we have a most beautiful example of that grand provision, of the all-wise & benificent Creator, by which the organism, has the extraordinary power of self recovery, after having undergone the excessive perversion, consequent upon the introduction of the more potent zymotic poisons, viz- the "Vis Medicatrix Naturæ". And from this, the observing physician, may learn a valuable lesson: that it is to this, rather than to any drug agency (exclusively), that he must look for the restoration of his patients.

It is a question of importance, how far it may be proper for the physician to interfere in the management of disease. I do not particularly allude now to the administration of drugs, for from this we have much less to fear in a wrong administration, than the Allopaths. Nevertheless, we must here exercise due caution. But, the mechanical, and collateral means, which in many instances, serve, as a faithful key to, a correct Diagnosis; such, as, inspection, palpation, pressure, succussion, percussion, measurement, auscultation &c. as the case may demand. These means, properly and prudently resorted to, will not only, in many instances, answer the design for which they are intended, but, will win the confidence of the patient, which in many instances, is the only

Medicament needed; and the best recommendation, for the success of the practitioner in future.

A knowledge too, of the different phases of disease as, the course, duration, period of remission, exacerbation, crisis, & termination, cannot safely be dispensed with. In making our Prognosis, it is necessary to take into consideration the condition of the system at the time of attack - the age and sex of the patient - the temperament & individual peculiarities or idiosyncrasies - hereditary tendencies - the general habits, as well as any previous disease which may have been preying upon the system, and the coincident influences by which the patient is surrounded. And then, the fact that certain diseases almost always end in

recovery, while others, have equally, a fatal termination. Some again, run a specific course, having certain stages, & ending about the same time.

The young practitioner is to remember that extreme dependence is not to be put in drugs alone. He is not to suppose that every instance of recovery under his management, is a cure from drugs merely. The physician at best, can only aid Nature. And, as was remarked by Prof. Beakley, "this aid can often be found in the creak of the Physicians boots". In the administration of remedies, we are taught to have reference to Constitutional treatment, as the first step, where there is exalted excitement, or great debility, but, when neither exist, to a great degree, to address our remedies at once to

the cause, when known. Now, I maintain, that drugs cannot be, reliably administered without a knowledge of Physio-Pathology. For it is self-evident that the size, and attenuation of the dose, should be proportionate to the intensity of the disease, and the temperament, and susceptibility of the individual. We are taught to use the lower attenuations in all diseases that run a rapid course, or which unless speedily checked, would lead, soon to complete disorganization of tissue; as in acute inflammations, congestions, &c. We should, therefore, be able to judge from the attending phenomena to what extent the internal organism is affected, and how much, and what attenuation it will require of the remedial agent, to make a favorable impression on the sys-

tem. In order, to reap the peculiar advantages of his Materia Medica the Homeopath should be thoroughly drilled in the correct pathogenesis of drugs, and the proper discrimination of symptoms, and at the same time, give due attention to every additional circumstance which may facilitate his choice of the appropriate remedy; such as the history of the case; the habits of the individual; a careful discrimination between cause & effect &c. All these combined will tend materially to overcome the difficulties which surround the Allopath, and render disease in his hands, one of so intractable a nature. In the treatment of disease, we are guided by laws of which the Empiric is totally ignorant. And upon this, Teste remarks;—“the Allopath has never known how to distin-

quish the physiological and dynamic action of drugs; and therefore, they class the same drug, at one time a debilitant, and, at another a tonic." Now, were they acquainted with the law of "Similia" they would know that any drug is best adapted to a Constitution, which, in a normal state, is most easily affected by the poisonous action of the same drug. For example: Arsenicum is capable of producing in a healthy person a general depression of the vitality, called Caco-chymia; simulating, the effect of a constant and exclusive vegetable diet, especially of herbs & watery fruits. It consequently follows by virtue of the law of similitude, that Arsenic, which is a most violent poison to individuals impoverished by a low diet, is, on the other hand, most admirably adapted to their Constitutions;

and to a majority of their maladies, if given in infinitesimal doses. Again; Gamie says; "the several Causes of disorder must always be attended to, and will when known, prove of great assistance in selecting the homeopathic remedy;" For instance;— in case the suppression or retro-pulsion of an eruption has called forth the disorder, we should look to Sulphur, or some other Antipsoric drug, as our remedy, at first. Or, when an habitual discharge, as the hemorrhoidal, menstrual, gonorrhoeal &c. has been suddenly checked, thereby producing the exciting cause; remedies appropriate to these several conditions, as the Case may be, must be selected, if a cure is to be effected. I heard one of the oldest, and most successful pioneers of Homeopathy in this Country say, that, "he never found

Pathology to assist in curing a disease Homeopathically." With all deference to his superior judgment, I must beg leave to differ in opinion, from the venerable "F.". Although I agree, that Pathology itself, does not cure disease; I do say, that ^{it} greatly and truly assists the intelligent physician, both in his Diagnosis and Therapeutics. For instance; take a case of Anemia, we are here made aware of the fact that the "fluida vitas", is deficient in nutritious properties, consequently, if this condition is kept up, all parts of the body, must eventually greatly suffer. But, we observe "nature", the greatest of physicians, here making a strong effort, to correct the abnormal condition of the blood; for we find that there is going continually up to the brain, from all parts

of the body, intimations of this suffering, in order, that through the process of Circulation, respiration, digestion, &c. the required Stamina may be supplied, and the deficiency corrected. The Brain is the great Centre of communication between the suffering tissues, and the vital organs, by the agency of which, the suffering is to be relieved. The brain, is, therefore powerfully excited as a consequence, and a state of great irritation is produced, which, though it may not end in inflammation, is capable of inducing functional disorders of that organ ending sometimes in convulsions, and death. Then, from this anemic condition there is required by the body, an additional supply of Blood, in order that each tissue may find its required por-

tion of nutriment, to supply which, the heart is excited, beyond its ordinary limits: Consequently, we have undue palpitation of this organ, which, without a knowledge of the cause, may be mistaken for organic disease of that viscus; while the true cause may remain untreated to a fatal neglect.

Again take a case of Diabetes Mellitus, which we distinguish from Diuresis Simplex, by a profuse secretion of saccharine urine. Now, will not a successful treatment, of this dreadful malady, altogether depend upon our knowledge of the Physiological, and Pathological Conditions of the system? Let us examine it.

This excess of sugar, which seems to characterize the disease, is the product of the combined solid, & fluid aliment taken by the patient. Now, from the researches

Of Drs McGregor and Bernard, it was found that there were two sources, or manufactories of Diabetic sugar or Glucose, in the human economy, viz: the Stomach and Liver. The sugar found in the Stomach of a diabetic patient, during Chymification, is passed into the Duodenum and small intestines, and failing there, of proper assimilation passes of necessity into the circulating to be eliminated by the Kidneys.

Now, sugar is formed in the Stomach of all persons in health, but, not directly. Amylaceous matters in the Stomach pass first into Dextrin, then into Glucose and ultimately, into vegetable or carb. acids. Now, it is supposed by physiologists, that in Diabetes, this series of changes is arrested by some unknown cause, after the production of sugar, which therefore accumulates.

Bernard found in health, no sugar in the portal vessels, proceeding towards the Liver, but abundantly in the venous blood, leading from that organ to the heart; passing thence into the lungs, where it is consumed in the process of respiration; as none can be detected, in a healthy state, in the oxygenated blood of the pulmonary veins. Now, if this sugar be produced in excess, beyond the Consumptive power, or, if from disease of the lungs the normal quantity be not consumed, in either case, we see the sugar must enter the general Circulation, stimulating the kidneys to excessive action and is thrown off, with an increased amount of the other constituents of the blood, which escape the vigilance of the renal functions occupied with its great duty of elim-

441

inating noxious matters. This great discharge of the product of solid and fluid matters, provokes thirst & hunger, which lead probably to an increase of the digestive disorder, and thus the vital actions of assimilation and secretion go on in a vicious circle which draws at length all the functions of the economy into its fatal vortex.

Now, the physician understanding these physiological derangements is prepared to treat the disease, But, without, he never can cure. Reasons: In conformity with the Pathological views given, the first indications of treatment, are, to prevent the formation of saccharine matters. How is this to be done? I have said above that the formation of sugar depended upon two sources, and must be manufactured from the aliment taken

by the patient. It is, obvious then that we must seek to alter the functional action of the Stomach and Liver; and at the same time forbid altogether the entrance into the stomach of such articles of food, as are of a sugar producing character. The first, if we can arrive at is obviously the most important; and, if accomplished would leave little else to be done. But, unhappily, we are yet ignorant to a great extent in what the gastric derangements consist, and therefore not able to strike directly at its root. The second indication can be carried out to a perhaps, favorable extent by the forbidding of all Amylaceous articles of food; such as, the grains, potatoes &c. And the patient restricted to a mild animal diet; as easily digestible meats; cream, cheese, butter,

soft boiled eggs, fish, oysters &c. The patient should not be allowed much drinks / ~~such~~, especially such, as have a tendency to the kidneys; as, the fermented liquors. Possessed of this knowledge the physician may hope of success; but without it there is no hope.

Again, - take a case of Phlebitis, and with a proper knowledge of its effects, the physician may accomplish much that will be highly creditable to himself and beneficial to his patient.

Dr. Wood, says, that, "some of the worst forms of Puerperal Fever owe their origin, and malignancy to Phlebitis originating in the veins of the Uterus. Also, Phlegmasia Alba Dolens, has, by Dr. Lee been traced to the same origin, which, if we hope to treat successfully we must have regard to its Etiology. As I have previously hinted, our success in

Therapeutics, depends upon a, correct,
Diagnosis, ^{of the disease,} as much as a correct Patho-
genesis of the dmg. to be used. For example:
 In Chest diseases, how essentially necessary
 to understand the Physiology of each organ.
 We find the law of sympathy so ample,
 that not one viscus can be diseased to a
 great extent without enlisting the sym-
 pathy of another. We must recollect too
 that all similar symptoms, are not to be
 treated always in the same manner, but
 according to the Cause. The intelligent
 physician therefore must, and will inves-
 tigate for himself, if he would not ride
 upon the same "horn of the dilemma",
 that a certain Allopathy did in prescribing
 a dose of Carb. Mag. without asking any ques-
 tions, for a child, with gastric derangement
 from concussion of the brain, from a
 fall while at play; which, as every well inf- /

formed practitioner knows, will produce vomiting, and other gastric symptoms, which are only symptomatic of the true cause, and therefore needs no treatment as such. Another case in point, was related to me by Prof. Helmuth, which occurred in his own practice. When called to the patient, he found him having from 20 to 35 stools in 24 hours. The patient, formerly a large portly man; now reduced to the opposite condition; disposition naturally gentle; now irascible and peevish; violent thirst and great prostration. The attending physician an (Allopath), was drenching him with Lager Beer, & drugs for the Liver, as his Diagnosis was abscess of that organ, with sympathetic affection of the bowels. Says Prof. H. - "I Diagnosed Chronic diarrhoea, with sympathetic affection of the

Giver." dismissed the "regular", stopped the Cold drinks, fed him on boiled goat's milk thickened with sun baked bread, gave Ars.³⁰ in the morning and Phos.³⁰ at night. The consequence was, that in five weeks, the patient was able to walk down street, and pay the mistaken "diagnostician" his bill."

The mass of community look upon Hemorrhage, as exceedingly dangerous, especially when it comes from some internal organ. Now, the physician must be on his guard. He should know that all Hemorrhages, are not so dangerous, as they appear to be. He should know that when moderate, they are often beneficial, and the arresting of them immediately, might prove injurious. In the Diagnosis of Hemorrhage much judgment is called for. If it be from the mouth, there is often much

difficulty. Epistaxis, may be mistaken for Haematemesis, especially if the patient be lying. Haematemesis, for Haemoptysis, or Stomatorrhagia, and "vice versa". The idea of blood spitting is so firmly fixed in the public mind, that few are found capable of resisting the impression entirely, even tho' told that it may be only vicarious to the Catamenia, or to some other suppressed condition of system. Or they may occur from irritating gases, or powders, tight lacing, or whatever exposes the pulmonary vessels to distention, or block up the abdomen, as pregnancy, ascites, abdominal tumors &c. all of which must be carefully sought after and considered. In Urticaria, we notice a condition, the origin of which demands careful attention, to prove successful in Therapeutics. We find the cause to be,

or, originate in, an internal irritation. Hence, we find it making its appearance, perhaps after some particular kinds of food, are eaten; as ice cream, fruits / ~~its~~ &c. or from constitutional idiosyncrasy, over exertion and the like. Little medical treatment is here needed. Care must be had in the choice of food, or sources of irritation; without which, medicines will be of little avail. At the same time, the causes may be such as a medical man only, can point out. The Homeopath can not be too careful, in discountenancing a too free use of cold, local applications in Cutaneous diseases, as fatal metastasis has resulted in numerous instances, from so doing. "Frank" relates an instance of fatal metastasis to the brain from cold lotions in a case of Urticaria. I believe many serious, if not

fatal diseases have arisen from the rash, and unphilosophical treatment of cutaneous affections, by the uninvestigating Allopaths. And, if we would not blindly tread the same path of "Contraria", with a "blind guide, and both fall into the ditch", we must investigate, study, search out, and rationally act, with a plausible reason for everything; so that we may not die, with the smitten conscience of the aged "Allopath", who upon his death bed, declared, that "his whole practice had been but a mass of experiments," unconnected with, and unguided by science. It was a true remark made by one of our distinguished State officers, in a public speech some months since, that, "the practice of medicine was rapidly losing reputation as an honorable profession and a progressive science;

and is become a mere routine of business, to which, the mass of Community were willing subjects, because of their refusal to think and reflect for themselves, and of their implicit obsequiousness to the vampiric influence of Empiricism."

I am led to think, there is more in the condition of the pulse, than many physicians believe. The mere feeling of the pulse, is too often but a fashionable custom with many, a kind of matter of course, act; which the practitioner, takes for granted must be done as a means of introduction; without knowing, afterwards why he did it, or without receiving any information as to the nature or condition of the system; and which passes for aptness and tact in the performer, and satisfies per-

54.
haps to some extent his patient, but
too often leaves the Dr. ignorant of his
real condition. I know not myself how
to fully appreciate it, but I think the
time not far distant when by the progress
of Physio-pathology, the state of the pulse
will determine much more to the phy-
sician, than is at present understood
by it. There are many times, close
investigation, and much judgment
required of the practitioner, to dis-
criminate between idiopathic and
sympathetic affections. We are not
always to suppose, that the seat
of pain, is at the locality of the
disease. Many ludicrous errors, have
been made, on this mistaken idea,
which have proved really serious, to
the patient, and mortifying to the
physician. Prof. Beakley told us of a

physician who had a case of Morbus-Coxaris, which he was treating with blisters on the knee, and had really set up a high state of inflammation in that joint, simply because he was ignorant of the fact, that a pain in the knee was the first symptom of a hip disease. There is much judgment required to discriminate Idiopathic and Sympathetic affections. From the fact that all portions of the system are so intimately connected by the great Sympathetic Chain, that an impression made upon one organ, is caused, for a wise purpose to vibrate through the whole, so that "when one member suffers all the others suffer with it". Thus, an abnormal action of the Heart, is often induced from diseased lungs, Liver, Stomach, or some other viscus. Therefore

we are not to infer a diseased Heart, without a proper investigation. We find also sometimes Eczema and Impetigo, attendant upon dentition, which no doubt, serve as a safeguard to the system and should be carefully treated. We find also, the same phenomena, occur at times during deranged menstruation, and accompanying pregnancy. Again, in Renal Calculi, and Calculi vesicae, we have unmistakable evidences, which to the uninitiated, would not seem probable. As already noticed in Concussion of the Brain we have gastric symptoms, Pains, tumors &c. in the Mammae, from Uterine diseases, grief, disappointment, &c. Diarrhoea, convulsions, & paralysis of the Legs, during dentition. Now the reason of all this sympathy is obvious, when we consider the two great sources of

irritation viz: the Brain and Sympa-
thetic nerve.

But I must bring this prolix article
to a close, after noticing one more item
which I think of importance. viz: the
treatment of Infantile Cyanosis. This
is a disease most frequently Congenital,
and originating in a malformation of
the Heart, which, according to Dr. Woods,
consists first in a want of closure in the
Foramen Ovale, and thereby constituting
a direct communication between the
venous and arterial system of Circula-
tion. And secondly, a partial or complete
obstruction of, or else obliteration of the
pulmonary artery; thereby obstructing
the free or entire access of blood to the lungs,
viz. consequently from undue aëration of the
Blood, arise the bluish, purplish, or livid
color of the skin; the coolness of the surface,

dyspnoea, palpitation of the heart, convulsions and syncope. It is often quick & ~~often~~ fatal, but may run on for many years, and sometimes from birth even to advanced life. Of 40 congenital cases recorded by Dr. Morton Stille, 17 died within a year; 10 between 1 and 10 years; 10, between 10 and 20; and 3 only survived the last mentioned period; of whom 1 attained the age of 57 years. The disease seems to have been more frequent in males than in females. I presume that little can be done by way of drugs, towards curing this malformation. My preceptor, Dr. C. Virgil Dare, recommends Nux. vom. as a good remedy. He thinks he has derived a benefit from its use here. We find the Pathology of this disease also in the pathogenesis of Digitalis, pur.

The remedial measure made use of by Dr. C. D. Meigs, Prof. of Obstetrics in the Jefferson College; is, - to "lay the infant on its right side, with its head and shoulders inclined upwards on pillows, and keep it so for several hours." The Dr. says, "by this treatment, he has succeeded in rescuing from impending death upwards of twenty persons".

Although, we may not be able to understand how this is; it matters not, it is not for puny man, to fathom the depths of "Divine Genius". Enough for us to know, that the great Benefactor of the human family, has placed in our hands a "Therapeutic Law," great indeed; and as good and effectual as it is great, because, of its origin, which is eminently able to contend with the Hydra-headed enemy of Health; And for which, our
